

AUSTRALIAN ISM, ESSENTIAL EIGHT AND IRAP COMPLIANCE SOFTWARE

A cleaner way for clients to prepare scope, evidence and assessor-ready outputs.

SecBoost helps organisations bring system context, implementation detail, evidence, registers, assessment activity and generated documentation into one structured workflow.

Better prepared clients

Assessment scope, implementation detail and evidence arrive in a consistent structure before review begins.

Less evidence chasing

Evidence, notes and clarification requests stay tied to the relevant ISM control record.

Cleaner outputs

SSP Annex, CCM, reports and supporting documents are generated from the same project record.

Scope

Clients capture system context, classification, stakeholders, hosting model, data profile and assessment boundary.

Evidence

Implementation claims, evidence attachments, observations and clarification activity sit against the relevant control.

DocSuite

Generate plans, policies, standards, registers, reports, SSP Annex and CCM from the same underlying data.

Collaborate

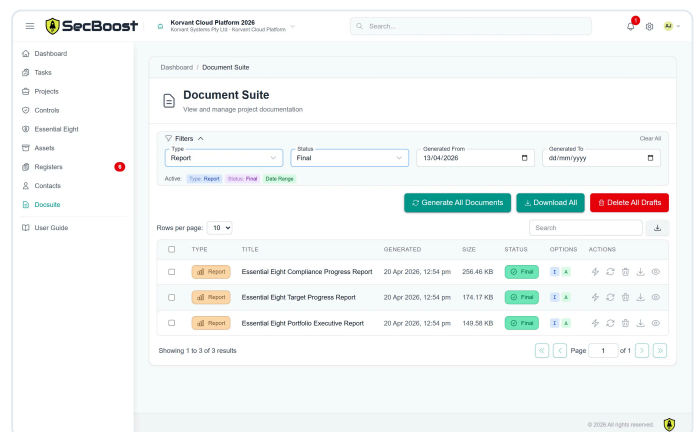

Assessors can review controls, record outcomes and return items for more information inside the workflow.

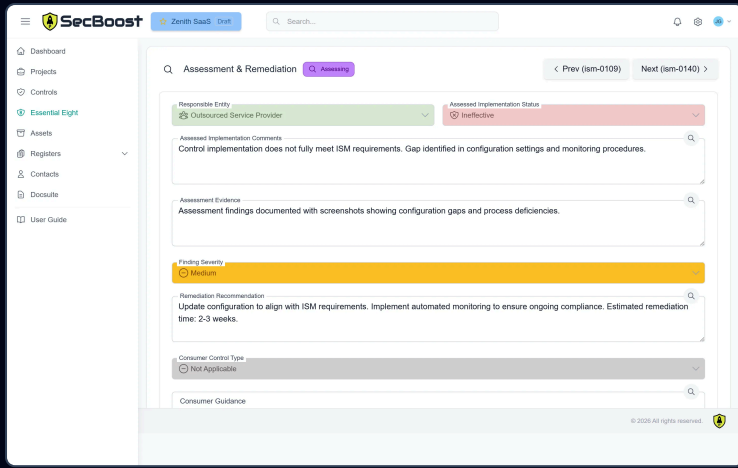

THE DOCSUITE ADVANTAGE

Generated documentation reflects the same record assessors review.

SecBoost not only tracks controls and evidence. The same organisation and system context, assessment scope, implementation detail, evidence trail and supporting registers can generate plans, policies, standards, reports, SSP Annex and CCM.

That consistency can reduce manual cross-checking between implementation claims and supporting documents, particularly for SMB and regulated supplier clients preparing for assessment.

ASSESSMENT WORKFLOW

Review evidence without losing the assessment context.

SecBoost is intended to help organisations arrive better prepared. Assessors can review implementation claims, evidence and outcomes in context while preserving independent professional judgement.

HOW IT WORKS

A structured path from preparation to assessment outputs.

01

Get the client into a structured project

The client defines assessment scope, organisation and system context, contacts and control applicability in SecBoost.

02

Review implementation and evidence

Assessors inspect implementation notes and evidence without navigating away from the control record.

03

Record outcomes and findings

Assessment activity is captured in the workflow, complete with audit trail, instead of a disconnected external tracker.

04

Request clarification in the workflow

If more information is needed, the assessor can return the control to the editor and keep the clarification within SecBoost.

05

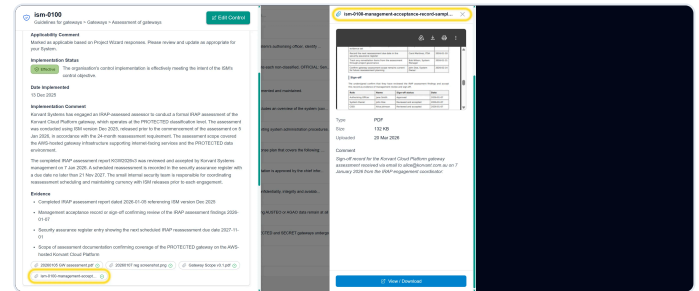

Finalise the assessment package

SecBoost produces structured outputs the client can maintain after review, including SSP Annex, CCM, OSCAL exports, DocSuite and living registers.

THE SECBOOST DIFFERENCE

Less document sprawl. Collaboration built in.

- ✔ Purpose-built for Australian ISM, Essential Eight and IRAP preparation workflows rather than generic compliance checklists.
- ✔ Designed to support assessor judgement, not replace it. SecBoost structures the material so review work can start from a cleaner baseline.
- ✔ DocSuite generation reduces divergence between implementation claims, evidence, registers and supporting documentation.
- ✔ Australian-owned platform with Australian cloud hosting plus on-site, in-house and air-gapped deployment options for sensitive environments.

ASSESSOR ENGAGEMENT MODELS

Assessor recommendation

Recommend SecBoost when a client is not ready for efficient review. They can organise scope, control responses, evidence and documents before assessor time is spent chasing basics.

SecBoost recommendation

When a client asks for assessor options, SecBoost can introduce assessors who understand the workflow, reducing platform handover and making review conversations more direct.

Firm portfolio workspace

Use Enterprise to manage multiple client projects, assign work across the team and keep assessment activity consistent across engagements.
